

Chat + Action Tracking System – Functional & Dashboard Design

1. Overview

This document describes how the Chat + Action Tracking feature should work, how users interact with it, and how dashboards should be structured. The goal is to transform chat conversations into actionable, trackable tasks without using AI.

2. How the Feature Works (User Flow)

- Users communicate normally through chat messages.
- Any message can be converted into an Action manually.
- Actions are structured items linked to the original message.
- Each action has an owner, status, and optional due date.
- All action updates are synced in real-time across users.

3. Action Lifecycle

An action follows a simple lifecycle. Once created, it remains linked to the original message and can be updated independently without altering chat history.

- Pending – Action created but not completed
- Done – Action completed by assigned user
- Cancelled – Action no longer required

4. Chat Interface Behavior

When a message is converted into an action, the chat UI displays an action card below the message. This card shows action title, assigned user, due date, and status. The original message content remains immutable.

5. Dashboard Design (Core Screen)

The Action Dashboard is a centralized view that allows users to manage their tasks efficiently. It should be accessible from the main navigation.

- My Actions – Tasks assigned to the logged-in user
- Created by Me – Tasks created by the user
- Overdue Actions – Highlighted with warning indicators
- Completed Actions – Archived and read-only

6. Dashboard Layout Recommendation

The dashboard should use a card or table-based layout with filters. Each action row should show Title, Conversation, Assigned User, Due Date, and Status. Quick actions such as Mark as Done or Open Chat should be available.

7. Permissions & Rules

- Only conversation participants can create actions

- Only assigned users or creators can update status
- Actions cannot modify or delete original messages
- All updates are logged and synced in real-time

8. Monetization Readiness

This feature is suitable for monetization. Free plans may limit the number of actions per conversation, while premium plans can offer unlimited actions, reminders, and analytics dashboards.
